SILICONE LINERS - 10,000 MILKINGS

Features and benefits

Liners that last 10,000 milkings

Replace each liner after 10,000 milkings instead of every 2,500 as necessary for rubber ones; reduce the money you spend on liners by 50% and the time you spend replacing them by 75%.

See every detail during milking

Clear liners and shells - you can see what's happening where and when it matters. Clear visibility means you can see whether cows are milking properly, you can see any clotting or blood in each of the four quarters, allowing earlier and more accurate diagnosis and resolution of issues.

Improved teat condition

Unique Silclear patented "drawing down" gentle massaging milking action instead of aggressive teat squeezing action of conventional liners. This means less teat end damage, less mastitis, improved cell counts and more valuable milk.

Lightweight but extremely tough polycarbonate shells; less teat and udder (bag) damage, more comfortable cows, less fidgeting in the parlour, more milk in the tank and less time spent milking; lighter clusters mean better working conditions for the dairyman - less risk of RSI.

Improved Bactoscans

Silicone - medical grade silicone material specifically developed by Silclear for the dairy industry over the last 25 years, easy to keep clean, does not perish or crack like rubber, tough and long-lasting; nothing in the silicone material to cause sores or lesions to the cows' delicate teat skin tissue; reduced risk of harbouring bugs and bacteria within the milk plant, so improved Bactoscans.

"I have been using Silclear liners and shells for over 10 years now, and have found them to be really good on the teat ends - the light weight and the way they milk out have given us no teat end damage. I can not see any advantage to going back to using older style heavy clusters. I also like the fact that the Silclear liners and shells are both clear, so I can see how my cows are milking. I can spot any problems straight away, and can get things resolved before they escalate into anything major."

Mike Ellis, Dairy Farmer, Petersfield, UK.

Unique Silclear patented drawing down action;

- 1** Silclear liners do not 'creep' up the teat so they do not cause damage to the delicate secretory tissue at the base of the udder.
- 2** Teats are not subjected to trauma or bruising; the soft supple silicone means all sizes of teat can be accommodated and milked efficiently and effectively.
- 3** Tapered pre-collapsed section which closes gently to massage the teat instead of aggressively squeezing it like other liners.
